

Scope and disclaimers

- am **not interested in fully visible final states** as standard mass reconstruction techniques apply
- will only consider **new particles of unknown mass** decaying to **invisible particles of unknown mass** (and other visible particles)
- selection bias – more emphasis on things I've worked with
 - Transverse masses, MT2, kinks, kinematic methods.
 - (Not Matrix Element / likelihood methods / loops)
- not shameless promotion – focus on **faults!**
